

# G-lambda/A Implementations and Tools for NSI CS v. 2.0

Atsuko Takefusa  
National Institute of Advanced Industrial  
Science and Technology (AIST)

# NSI Architecture and the Connection Service (CS) Protocol

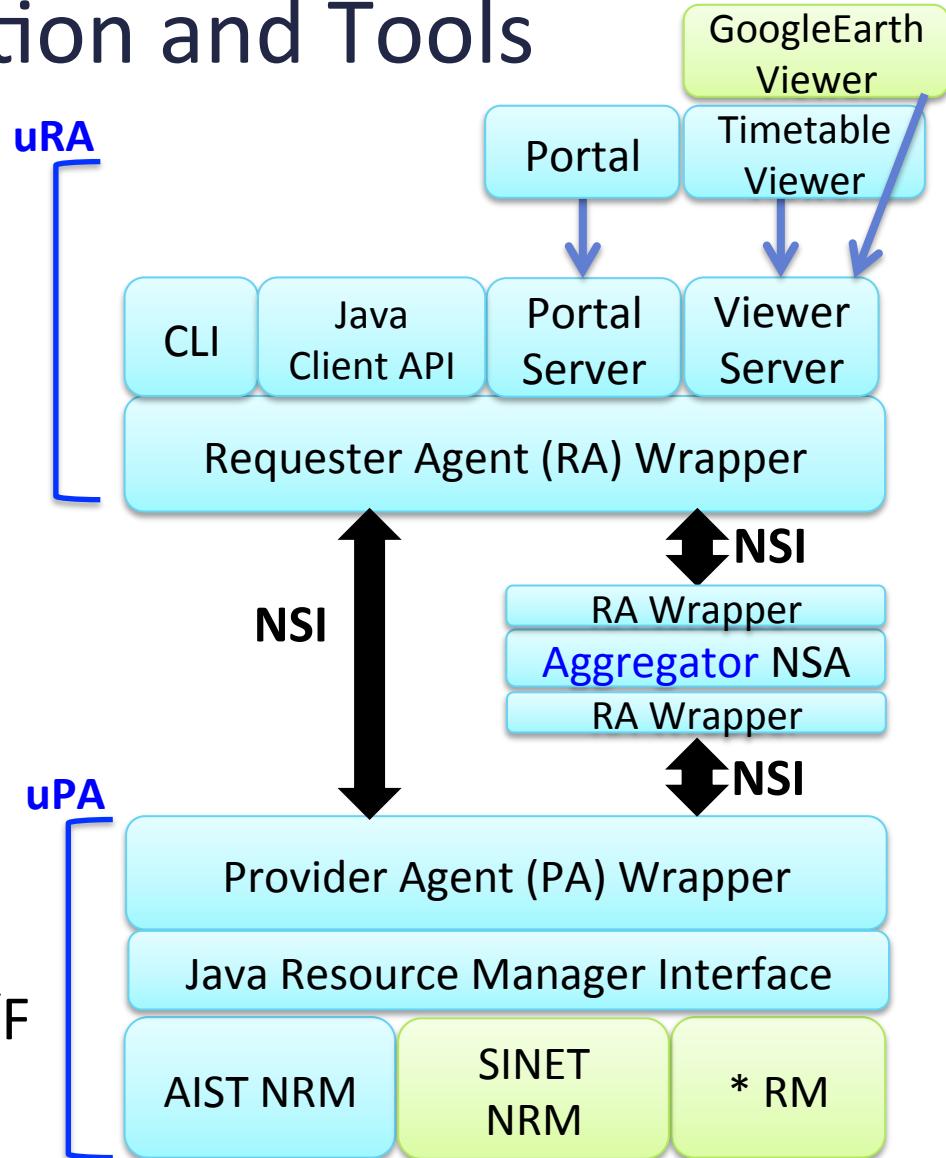

# Contributions

- AIST has developed G-lambda/A NSA implementations and tools for NSI CS v. 2.0
  - uRA modules
  - Aggregator NSA
  - uPA modules
- Our package is an open-source software and used by third parties
  - SINET PA uses our package on top of their own network provisioning system
  - UltraGrid application, Google Earth viewer

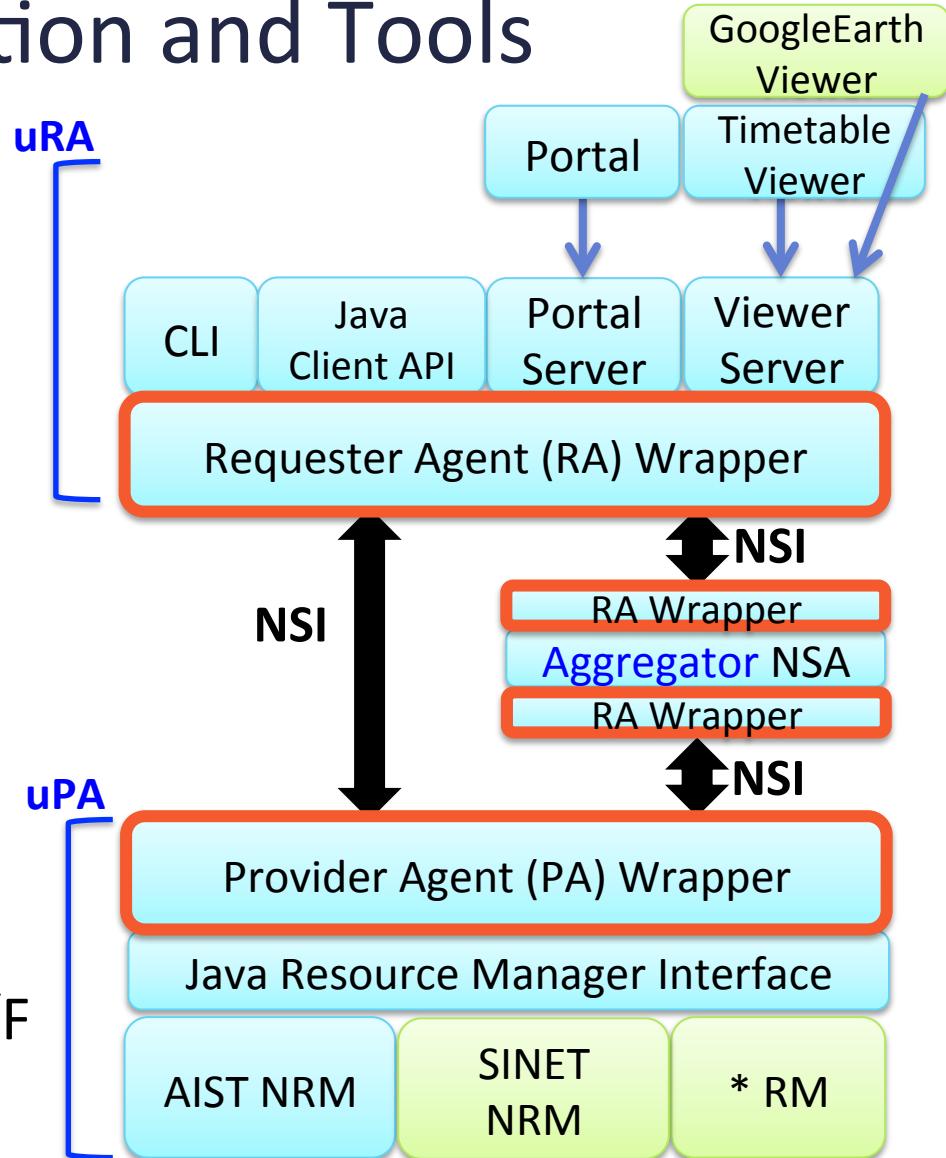

# Overview of the G-lambda/A Implementation and Tools

- RA/PA Wrappers
- uRA modules
  - CLI
  - Java Client API
  - Portal Server and Portal
  - Viewer Server and Timetable Viewer
- Aggregator NSA
- uPA modules
  - Java Resource Manager I/F
  - AIST NRM

# Overview of the G-lambda/A Implementation and Tools

- RA/PA Wrappers
- uRA modules
  - CLI
  - Java Client API
  - Portal Server and Portal
  - Viewer Server and Timetable Viewer
- Aggregator NSA
- uPA modules
  - Java Resource Manager I/F
  - AIST NRM

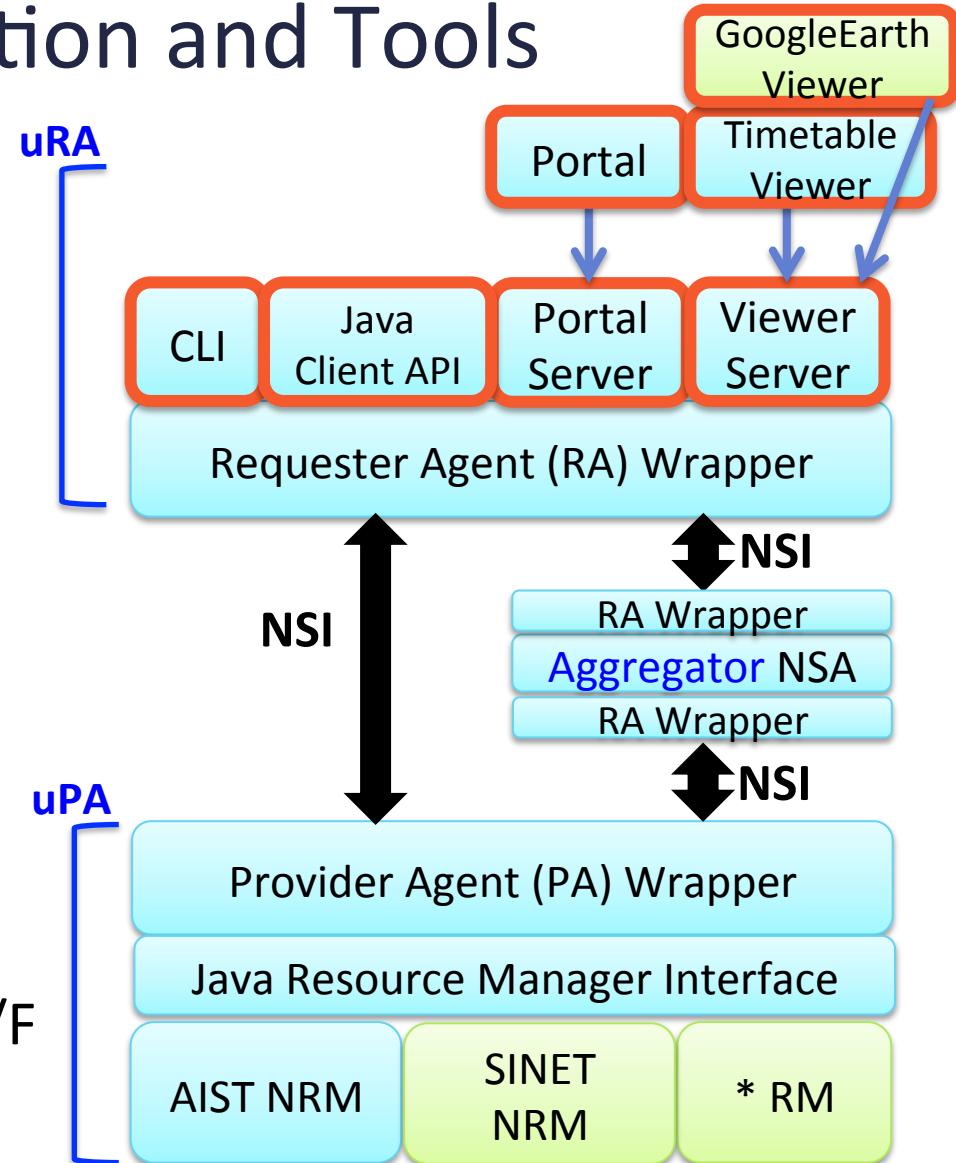

# RA/PA Wrappers

- All of G-lambda/A NSAs written in Java are running on the Jetty Java application server
- RA and PA Wrappers are generated from the NSI CS v. 2.0 wsdl's and schemas using Apache CXF, an open-source web services framework

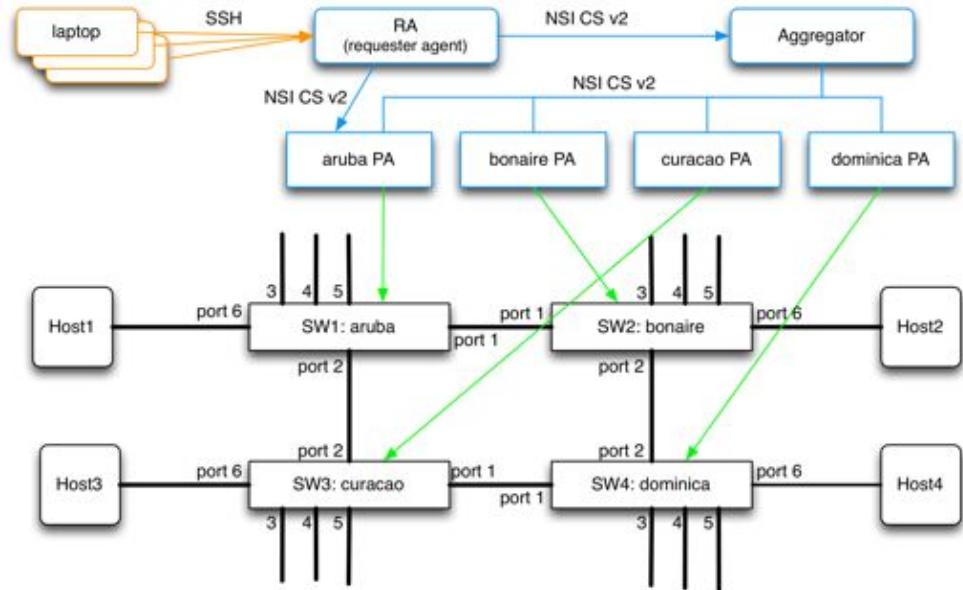

# Overview of the G-lambda/A Implementation and Tools

- RA/PA Wrappers
- uRA modules
  - CLI
  - Java Client API
  - Portal Server and Portal
  - Viewer Server and Timetable Viewer
- Aggregator NSA
- uPA modules
  - Java Resource Manager I/F
  - AIST NRM

# uRA module: CLI (Command Line I/F)

- Enables to send a NSI CS request to Aggregators and uPAs
- Provides commands: reserve, commit/abort, provision, release, terminate and query
- Confirmed, failed and notification messages are asynchronously shown up on the user terminal
- Used at NSI hands-on tutorial at TIP2013 and APAN36

APAN36@Daejeon

# uRA module: Java Client API

- Allows to develop uPA applications without detailed NSI CS knowledges
- Supports to access to PAs with http/https user and password authentication and OAuth2
- Application examples
  - Request Scheduler at GLIF2013 and SC13 demonstrations
  - UltraGrid application developed by CzechLight

Pseudo code

```
// Create NSI2Client instance
NSI2Client client = new NSI2Client(
    providerNSA, providerURI, requesterNSA,
    requesterURI, replyWaitMsec, listener);

// Create criteria instance
ReservationRequestCriteriaType criteria =
    TypesBuilder.makeReservationRequestCriteriaT
    ype(
        schedule, srcstp, vlan, deststp, vlan, capacity);
criteria.setVersion(currentVersion);

// Send reserve request
// rsvReply returns when cf msg has received
ReserveReply rsvReply = client.reserve(
    connectionId, globalReservationId,
    description, criteria);

// Send reserveCommit request
ReserveCommitReply commitReply =
    client.reserveCommit(reply.getConnectionId());
```

# uRA module: Portal Server and Portal

- Portal Server
  - Provides simple REST I/F required for portal
- Portal
  - Provide simple GUI to send, receive and show each NSI CS v. 2 operation

The screenshot shows a web browser window titled "NSI portal" at the URL "IP Address > :28075/service/portal.html". The interface is divided into several sections:

- Route Selection:** A form with fields for Source (geant.net), Destination (icair.org), and Path. Red arrows point from the labels "network ID", "local ID", and "VLAN" to the dropdown menus for each field.
- Current Statuses:** A section labeled "R:RESERVE\_HELD, P:RELEASED, L:CREATED, D:ACT=FALSE,VER=0,CONS=TRUE" with a red bracket grouping it under the heading "current statuses".
- Received Messages:** A log area containing several lines of JSON-like text representing NSI messages. A red bracket groups the first two lines under the heading "Details of received messages".
- Log Area:** The bottom of the interface contains a "Clear Log" button.

```

==== RESERVE request ====

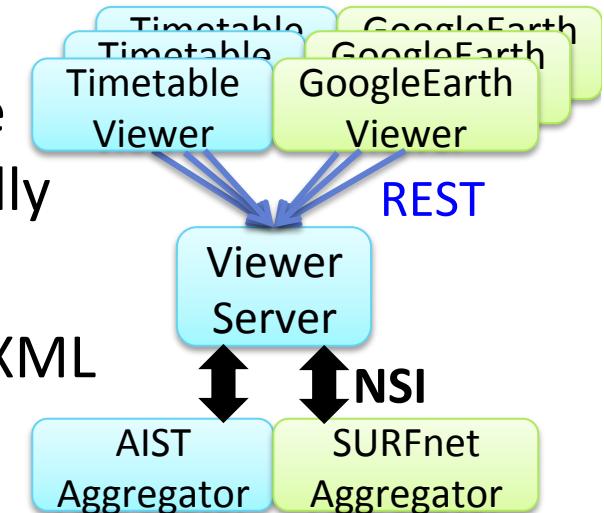

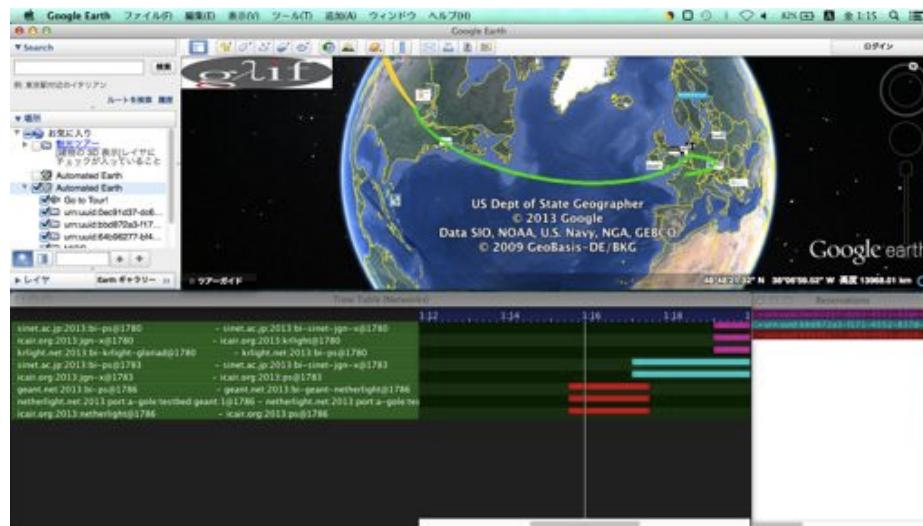

```

# uRA module: Viewer Server and Viewers

- **Viewer Server**

- Retrieves all of reservation info from the SURFnet and AIST aggregators periodically
  - via query request w/o connectionId
- Gives viewer instances reservation info XML via REST I/F

- **Viewers at GLIF2013 and SC13 demo**

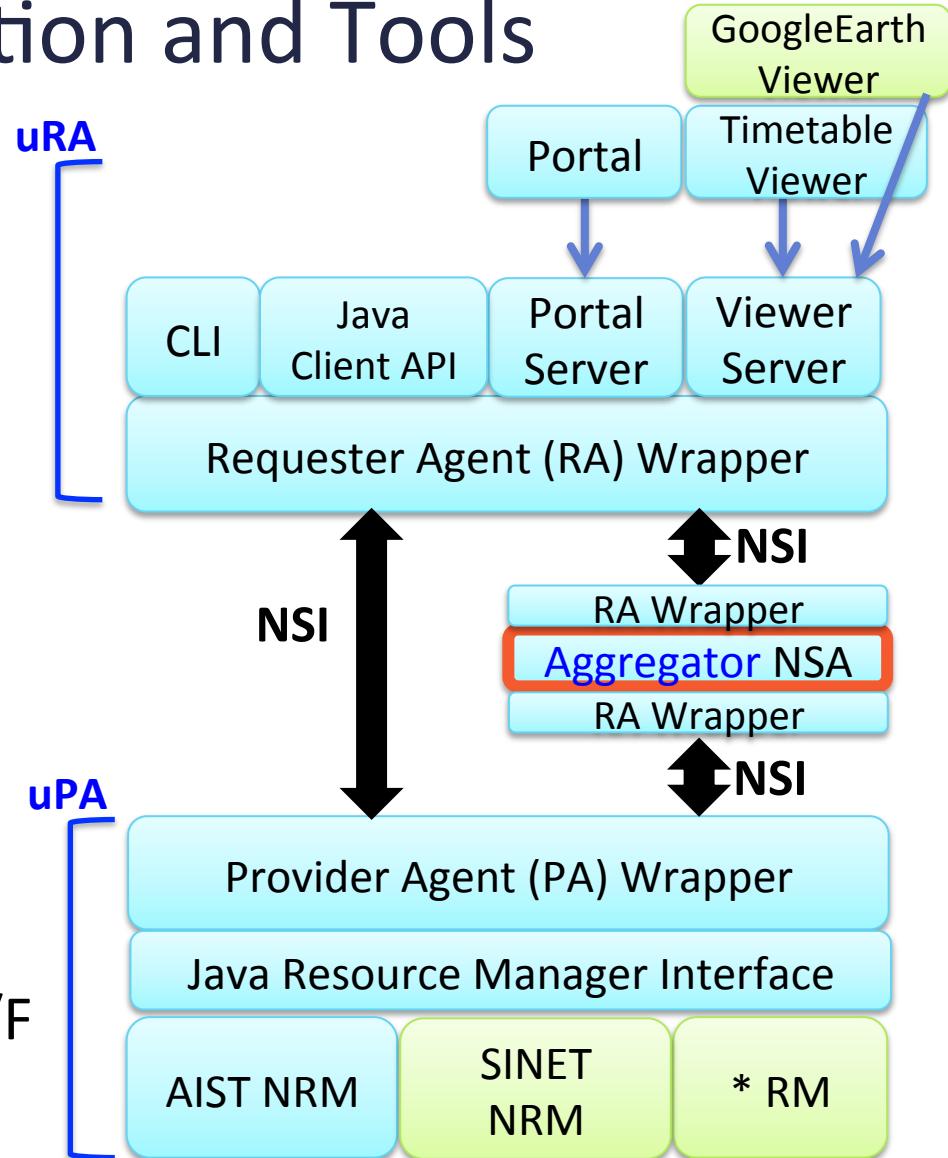

Google Earth Viewer  
developed by KDDI

Timetable Viewer  
developed by AIST

# Overview of the G-lambda/A Implementation and Tools

- RA/PA Wrappers
- uRA modules
  - CLI
  - Java Client API
  - Portal Server and Portal
  - Viewer Server and Timetable Viewer
- Aggregator NSA
- uPA modules
  - Java Resource Manager I/F
  - AIST NRM

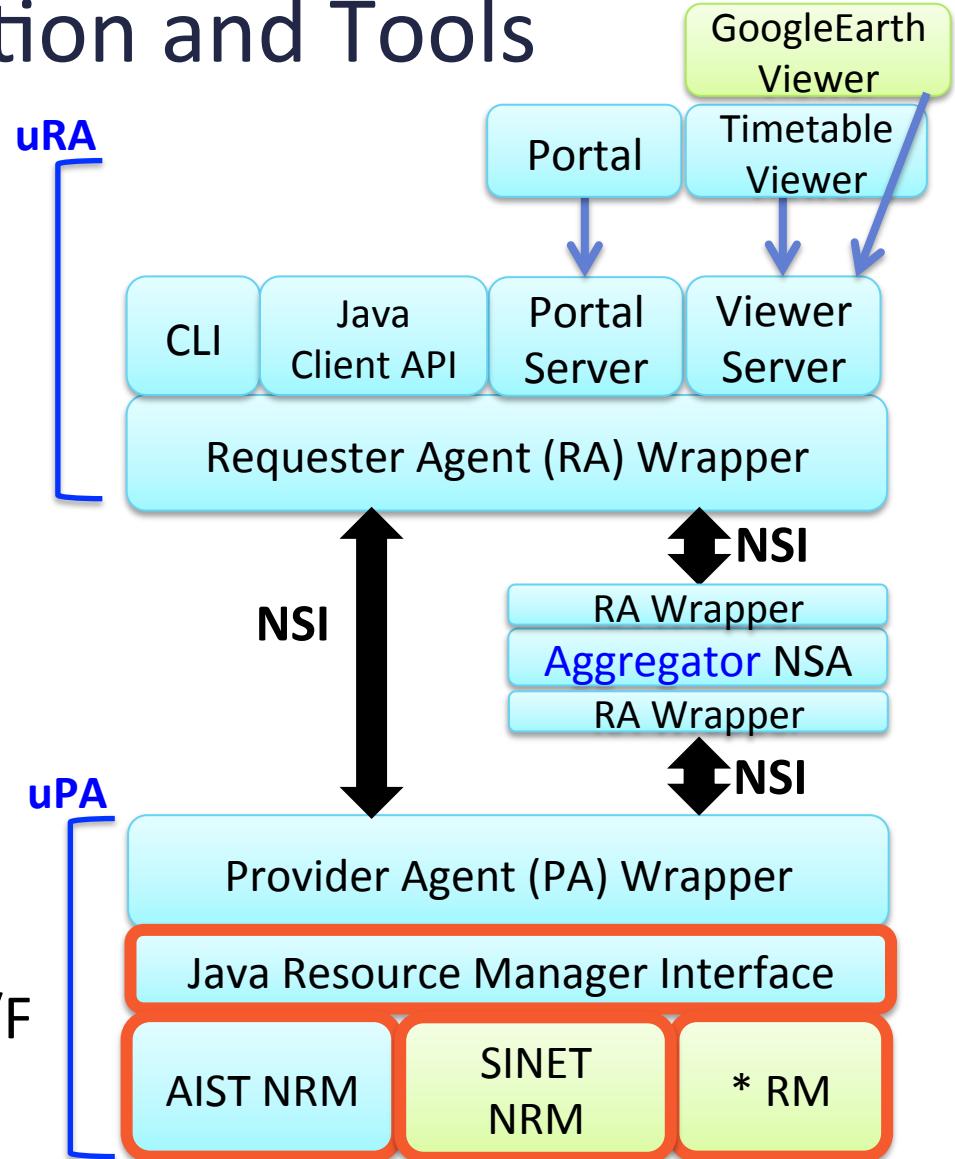

# Aggregator NSA

- Downloads topology files, described by each network provider, and calculates available paths between all of STPs in advance
- For each request, Aggregator sends requests to the corresponding PAs simultaneously, and returns aggregated response to the requester
- Can negotiate multiple PA implementations with various authentication models
  - http/https user and password authentication and OAuth2

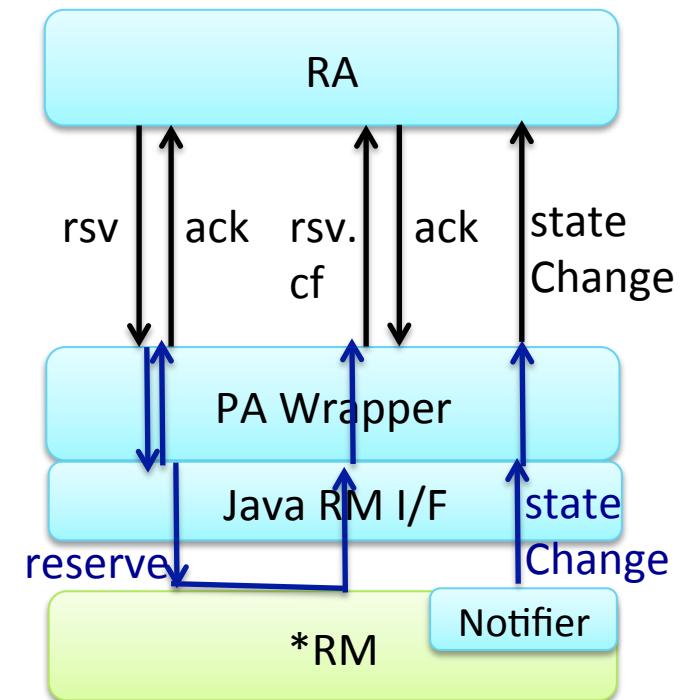

# Overview of the G-lambda/A Implementation and Tools

- RA/PA Wrappers
- uRA modules
  - CLI
  - Java Client API
  - Portal Server and Portal
  - Viewer Server and Timetable Viewer
- Aggregator NSA
- uPA modules
  - Java Resource Manager I/F
  - AIST NRM

# Java Resource Manager Interface

- Provides SPI (Service Provider I/F) to allow to develop a NSI CS v. 2-compliant PA
  - Receives CS operations (reserve, provision, release, terminate) and returns ack and confirmed/failed messages to the requester
  - Replies query-related operations
  - Absorbs the difference between minor wsdl/schema changes
- “Notifier” provides callback functions to send notifications from NRM
  - void dataPlaneStateChange()
  - void errorEvent()
- SINET PA provided by NII and AIST PA are developed using the Java RM I/F
  - SINET PA uses the I/F on top of their own network provisioning system

# Java Resource Manager SPI

```
public interface NSI2ResourceManagerBase {  
    public void setNotifier(Notifier notifier);  
    public void commit(CommonHeaderType header, String connectionId) throws  
ServiceException;  
    public void abort(CommonHeaderType header, String connectionId) throws ServiceException;  
    public void provision(CommonHeaderType header, String connectionId) throws  
ServiceException;  
    public void release(CommonHeaderType header, String connectionId) throws  
ServiceException;  
    public void terminate(CommonHeaderType header, String connectionId) throws  
ServiceException;  
}
```

```
public interface EthernetResourceManager {  
    public void reserve(CommonHeaderType header, String connectionId, String  
globalReservationId, String description, EthernetCriteria criteria) throws ServiceException;  
    public void modify(CommonHeaderType header, String connectionId, String  
globalReservationId, String description, EthernetCriteria criteria) throws ServiceException;  
}
```

# Summary

- AIST has developed G-lambda/A NSA implementations and tools for NSI CS v. 2.0
  - uRA modules: CLI, Java Client API, Portal Server and Portal, Timetable Viewer and Viewer Server
  - Aggregator NSA
  - uPA modules: Java Resource Manager I/F, AIST NRM
- NSI Application, PA and viewer by using our package have been developed by third parties
  - SINET PA, UltraGrid application, Google Earth Viewer
- The package is an open-source software and available at <http://www.g-lambda.net/gridars>
- Portal REST I/F and viewer(monitored) architecture and its I/F need to be standardized
