

EGR-RG Re-Charter Discussion

Ravi Subramaniam

Satoshi Itoh

Key Objectives, Deliverables and Responsibilities

- Capture requirements from sources that are not already covered by other groups such as Storage Networking Community Group (SN-CG), Pharmaceutical, Telco, EDA or Financial verticals
- Rollup the requirements from all sources (including eScience) into a common requirements base
- Prioritize the requirements
- Work with the OGF's Standards function, via the TSC (Technical Steering Committee) to influence the standards development effort to comprehend the requirements.

Key Objectives, Deliverables and Responsibilities (contd.)

- Communicate to Enterprise and eScience community the requirements that OGF already comprehends as documented by the TSC roadmap.
- Build and maintain a web accessible requirements repository.
- Define a standard format for representing requirements in the requirements repository.
- Analyze requirements in order to extract requirements patterns that are ultimately what is used to determine alignment with the current standards roadmap.
- Represent prioritized requirements to the TSC in order to determine the gap between those requirements and the current work that the standards.
- Integrate the “original” OGF requirements into the requirements repository. This is expected to be a one-time integration effort; so, after this point, only new requirements would be added to the requirements repository

Key Success Metrics

- Degree of participation in representing Grid requirements
- Degree of integration of requirements into OGF standards efforts
- Coverage rating from the OGF community about how well that the captured requirements represent the OGF community
