

OGSA Teleconference
February 7, 2008
EMS Scenarios discussion

Attending:
Hiro Kishimoto
Andreas Savva
Donal Fellows
Andrew Grimshaw (Minutes)

Minutes approved from the London F2F

No action items – moved on.

Andrew presented the simple deployments document.
Andreas – says re-write to present the need for a new spec, what one might like, include sample deployment document with XML, also JSDL document.

The consensus is that the first protocol is preferred.

Also, the deployment service should publish the applications that are deployed. Also need “undeployment”.

Action: Andrew to re-write by OGF 22.

Donal presented the “Complex Selected Job Execution”

The main difference with the simple case is that there are multiple BES containers, each of which has a non-zero chance of failure of job submission.

This scenario addresses the initial placement process.

Andreas – if he puts the “manage activity” on the activity itself to indicate the “need” of such a specification.

Andreas - 4.2.5, point four, it is really up to the job manager, not the user agent.

Discussed appendices – no problems.

Discussed XQuery extensions to candidate set generator. Will be left for next version.

Discussed moving some of the highlighted sections in the appendix into the main document.

Completed at 0953 EST.
